

Control Plan - IATF 16949 Clause Mapping

Audit-Ready Reference | Quality Head Agents

Clause 8.5.1 - Control Plan

IATF mandates a Control Plan for each product family. It must be developed during APQP Phase 3 and cover: prototype (if applicable), pre-launch, and production phases. The CP must be reviewed and approved before the production trial run.

Clause 8.5.1.1 - CP Requirements

CP must include: process step, characteristic, specification, measurement system, sample plan, control method, and reaction plan. CC/SC must be identified. The CP must be linked to the PFMEA and Work Instructions.

Clause 8.6.2 - Layout Inspection

Annual revalidation: the Control Plan must be verified annually through a full layout inspection. If any characteristic fails, the CP must be updated and a corrective action initiated. Evidence of annual layout review is required for IATF.

Clause 8.5.6.1 - Change Control

When a process or design change occurs, the Control Plan must be updated before implementing the change. The revision history must show the change, reason, and date. Customer approval may be required for CP changes affecting CC/SC.

Clause 8.7.1 - Nonconforming Control

Customer complaints and internal rejections must trigger a review of the relevant Control Plan row. If the control failed to detect the defect, the detection method must be strengthened. Evidence of this review is required.

Top Audit Questions

1. Show me the Control Plan for this process. 2. How is this CC characteristic being controlled - show me the gauge and records. 3. What is the reaction plan if this goes out of spec? 4. When was this CP last reviewed and updated? 5. Show me the link between this CP row and the corresponding PFMEA failure mode.
